## **Laplace Transform Solution**

Laplace transforms are a type of integral transform that are great for making unruly differential equations more manageable. Simply take the Laplace transform of the differential equation in question, solve that equation algebraically, and try to find the inverse transform. Here's the Laplace transform of the function  $f(t)$ :

## **Solving Differential Equations Using Laplace Transform ...**

The Laplace transform is an integral transform that is widely used to solve linear differential equations with constant coefficients. When such a differential equation is transformed into Laplace space, the result is an algebraic equation, which is much easier to solve.

engineering and electrical engineering. The Laplace transform reduces a linear differential equation to an algebraic equation, which can then be solved by the formal rules of algebra.

## **Laplace transform - Wikipedia**

The Laplace transform is a well established mathematical technique for solving a differential equation. Many mathematical problems are solved using transformations. The idea is to transform the problem into another problem that is easier to solve.

## **Laplace Transform- Definition, Properties, Formula ...**

Laplace Transform The Laplace transform can be used to solve differential equations. Besides being a different and efficient alternative to variation of parameters and undetermined coefficients, the Laplace method is particularly advantageous for input terms that are piecewise-defined, periodic or impulsive.

Solution. (a) Using the definition of Laplace transform we see that  $\mathcal{L}\{e^{at}\} = \int_0^{\infty} e^{-st} e^{at} dt = \lim_{T \rightarrow \infty} \int_0^T e^{-(s-a)t} dt$ . But  $\int_0^T e^{-(s-a)t} dt = \frac{1}{s-a} (1 - e^{-(s-a)T})$  if  $s \neq a$ . For the improper integral to converge we need  $s > a$ : In this case,
