Principles of water jet cutting. There are two types of water jet cutting processes; pure water cutting, in which the cutting is performed using only an ultra-high pressure jet of clean water, and abrasive water jet cutting in which an abrasive (typically garnet) is introduced into the high pressure stream. Pure water cutting can be employed to profile a huge variety of materials, these will typically be 'soft' materials such as gaskets, rubber, foam & plastics.

Principles of Water Jet Cutting - One Stop Sealing

The principles of abrasive water jet cutting are similar to pure water jet cutting, but within the nozzle is a mixing chamber where the garnet is introduced. Abrasive cutting is typically used when cutting materials such as stainless steel, aluminium, stone, ceramics and composites.

Water Jet and Abrasive Water Jet Machining : Principle ...

It is based on the principle of water erosion. When a high-velocity jet of water strikes the surface, the removal of material takes place. Pure water jet is used to machine softer materials. But to cut harder materials, some abrasive particles mixed with the water for machining and it is called as AWJM (Abrasive Water Jet Machining) Abrasive Materials

Water Jet Machining - Working Principle, Advantages and ...

A water jet cutter, also known as a water jet or waterjet, is an industrial tool capable of cutting a wide variety of materials using a very high-pressure jet of water, or a mixture of water and an abrasive substance. The term abrasive jet refers specifically to the use of a mixture of water and abrasive to cut hard materials such as metal or granite, while the terms pure waterjet and water ...

This high pressuring abrasive carried gas send to nozzle where its pressure energy converted into kinetic energy. The velocity of abrasive particle leaving the nozzle is about 200m/s. The standoff distance between work piece and nozzle is about 2mm. Now these high velocity abrasive particles impinge on work piece.

Abrasive Jet Machining: Principle, Working, Equipment's ...

Explanations are given as the book follows the development of an abrasive water jet machining process, from tool generation through to machining results, supervision and control. This methodical journey through the field is marked by drawings, graphs and tables, many of which are being published here for the first time.

Principles of Abrasive Water Jet Machining | SpringerLink

Abrasive water jet machining (AWJM) is a mechanical material removal process used to erode holes and cavities by the impact of abrasive particles of the slurry on hard and brittle materials. Since the process is non-thermal, non-chemical and non-electrical it creates no change in the metallurgical and physical properties of the work piece.

The jet then passes through a venturi section where a metered amount of granular abrasive is drawn into the water stream. The mixture of water and abrasive particles passes through a special ceramic mixing tube and the resulting abrasive/water slurry exits the nozzle as a coherent cutting stream of abrasive particles traveling at very high speed.
