A radio frequency integrated circuit is a compact electronic circuit that uses active devices for signal frequencies in the so-called radio frequency (RF) range. Radio frequency circuits include low- and high-power amplifiers, modulators, and demodulators. Amplifiers increase the voltage or power level of RF signals.

What Is a Radio Frequency Integrated Circuit? (with picture)

These silicon RF integrated circuits are widely referred to as RFICs, and the historic distinction between "RF" and "microwave" has been lost. In the sub 6 GHz region, GaAs technology has been relegated to a few niche areas such as switches and high efficiency power amplifiers.
